antiphage serum yielded a high percentage (15-20%) of ts-mutants. Preliminary classification of the ts-mutants by a complementation test divided them into 50 groups. Some groups had 4-7 mutants, others 2, and the majority one. A physiological study of the ts-mutants showed that their thermal sensitivity is related to the thermolability of the intracellular developmental stages. Differences were found in mutant inactivation kinetics when applying the one step growth cycle according to Adams at 42 C. On the basis of these differences the mutants may be divided into 4 phenotypes. The fact that these mutants were preliminarily distributed over 50 groups indicates that many genes are affected by mutations. The tests confirmed the assumption that conditionally lethal mutations may be induced from the bacteriophage T4B. Orig. art. has: 6 tables and 2 figures.

ABSTRACT: A new method of inducing temperature-sensitive
bacteriophage T4B mutants with disturbed synthesis of various
enzymes, particularly those required for DNA synthesis, is described.
E. coli B strains were infected with bacteriophage T4B and cultivated
in a broth using 2,6-diaminopurine, hydroxylamine, ultraviolet light,
and 5-bromouracil as mutagenic agents. Mutants were selected from
a total of 298 colonies by methods of absolute selection,
minute-phenotype, and antiphage serum. In contrast to phage T4B, the
mutants behave differently at 27 and 42 C. Hydroxylamine with

PURPOSE: This collection of articles is intended for a wide range of geologists and research workers interested in oil problems.

COVERAGE: Articles contained in this book deal with the problems of migration and accumulation of oil and gas. These problems were discussed in May 1957 at Lvov State University im. I. Franko at a meeting organized jointly by the Institute of Geology and Mineral Resources, Academy of Sciences of the USSR, the Departments of Geology and Oil Exploration of the Lvov Polytechnic Institute, and the Lvov Geological Society. Theories on the origin of oil and petroleum deposits and the conditions surrounding their occurrence are treated. There are 327 references: 232 Soviet, 5 French, and 4 German.

and bituminous substances of the petroleum series. The author believes that the difference is attributable to specific conditions accompanying the transformation of organic substance in different environments. An aqueous environment has a particularly strong effect in formation of bituminous substances.

Card 3/3

Chemical Nature of Dispersed Bitumens (Cont.)

basic elements of the extraction process and the effect of various factors is discussed here. In extraction of kerogene, a unique process of "destruction" of the original organic substance occurs; bitumens are formed as a result. The relations of the hydrocarbon compounds in petroleum to kerogene are discussed in the third part. Diagnostic criteria are presented in this part. Petroleum bitumens are characterized by low molecular weight, nonassociated individual compounds and the absence of structural fragments of plant-animal substance. They contain small amounts of non-hydrocarbon constituents and have low acid and saponification numbers. In contrast, bitumens extracted from various kerogene rocks are characterized by the absence of individual hydrocarbons of low molecular weight, by a high content of hydrocarbon constituents, and the presence of structural fragments. The bitumens of the coal series have high acid, iodine, and saponification numbers. There is, therefore, a fundamental difference in chemical nature of bituminous substances of the coal type (including kerogene and "petroleum-bearing rocks")

ABSTRACT: The first part of the article deals with the chemical nature and classification of bitumens. The author comments on the broad use of the term bitumen in the petroleum, coal, shale, and peat industries as well as in the geochemistry of dispersed organic substances. The term is used synonymously for natural products of petroleum and non-petroleum origin. The second part is devoted to the composition and methods of separation of the bituminous part of kerogene. The

Author, it is also pointed out that the ω -values of valence rectifiers are always below unity. The frequency characteristics of silicon and germanium diode rectifiers in oscillatory circuits were also investigated. The results of the experiments are compared with the theory of Avak'yants et al. (Radiofizika i elektronika, v. 7, no. 7, 1962, 1214-1222). Conclusions: Inductances of silicon and germanium rectifiers can reach large values, their ω -values being rather low. The latter disadvantage can be compensated for by including a negative resistivity element in series with the diode. There are 10 figures. TITLE: Inductive properties of selenium rectifiers

PUBLICATION: Radiotekhnika i elektronika, v. 7, no. 7, 1962,
1223-1229

TEXT: Inductive effects were observed experimentally when a bias voltage was applied in the reverse direction across the elements. The impedance of the selenium rectifiers was measured by a bridge method for temperatures ranging from -100 to +170°C in the presence of reverse bias voltages up to 30 V. The inductive properties were described in terms of the 'negative capacitance' of the rectifier defined by: $\omega L = 1/\omega C$. The results are presented in the form of inductance and capacitance curves as functions of the bias voltage for various temperatures. The inductive properties of selenium rectifiers occur at low temperatures, though rectifiers showing negative capacitance at room temperature were pointed out by the

TITLE: Inductance of semiconductor diodes

PERIODICAL: Radiotekhnika i elektronika, v. 7, no. 7, 1962,
1214-1222

TEXT: Following a previous investigation of the inductive properties of semiconductor diodes induced by thermal effects (G. M. Avak'yants, AN SSSR. Izvestiya. Seriya fiz.-mat. 1955, 8), a theory of the inductive properties is developed considering the influence of the relaxation processes accompanying the impact ionization of impurities in the space-charge region of the diode. The phase-shift of the current against the voltage is expressed in terms of the transfer of electrons from the valence band on to the donor levels, neglecting the effects of the recombination of the holes by the donor level electrons as well as the thermal transitions of electrons from the donor levels into the conductivity band. It is shown that the energy can be stored in the semiconductor diodes as

TITLE: Effect of reverse current on forward resistance in selenium rectifiers
[Report at the All-Union Conference on Semiconductor Devices, Tashkent, 2-7 October,
1961]

SOURCE: Elektronno-dy*rochny*ye perekhody* v poluprovodnikakh. Tashkent, Izd-vo
AN UzSSR, 1962, 83-86

TOPIC TAGS: selenium rectifier creep, TVS selenium rectifier

ABSTRACT: Experimental studies of the "forward current-voltage characteristic
creep" are described. A considerable increase in the forward voltage drop upon the
passage of a reverse current is referred to as a "creep". It is very pronounced in
TVS-type selenium rectifiers. The creep was measured at various temperatures within
-70+138C, on a-c and pulsating current, at various reverse voltages. Forward
current-voltage, forward voltage-temperature, forward voltage-time, forward voltage-
reverse voltage, and forward voltage-frequency curves are presented. This explana-
tion is offered for the creep: the diffusion potential, i. e. the contact potential.

Card 1/2

L 11147-63
ACCESSION NR: AT3002977

that, with the forward current increasing, the reverse current through a p-n junction increases up to a certain critical point, and then decreases; under static conditions the reverse current is smaller than under dynamic and pulsating conditions. Reverse current-voltage characteristics, reverse current vs. temperature (within -100 + 100°C), and reverse current vs. forward current curves were taken experimentally for types AVS and TVS selenium rectifiers; the curves are presented in the article. "In conclusion the authors express their gratitude to O. G. Bakradze for the assistance in measurements." Orig. art. has: 3 figures and 19 formulas.

[Report at the All-Union Conference on Semiconductor Devices, Tashkent, 2-7 October,
1961]

SOURCE: Elektronno-dy*rochny*ye perekhody* v poluprovodnikakh. Tashkent, Izd-vo
AN UzSSR, 1962, 40-48

TOPIC TAGS: AVS selenium rectifier, TVS selenium rectifier, selenium rectifier
reverse current

ABSTRACT: It has been known that passing a forward current through a selenium
rectifier renders appreciable influence on the magnitude of the reverse current.
A theoretical and experimental investigation described in the article shows that,
beginning with a certain value of the reverse-voltage amplitude, the reverse
current drops when the forward current is turned on. Also, the reverse current
depends on the voltage to a lesser degree when the forward current is on. A
differential equation is written for a "thin" diode which describes the variation
of hole concentrations on the "deep" impurities. A solution of this equation shows

P-401 germanium transistors, with the base free. Silicon photocells, not illuminated, biased deep into the reverse-current region, with a 1-kc signal of 15-20 mv, exhibited inductance of a few henrys; however, the inductance was unstable in time. The effect is attributed to technological peculiarities in manufacturing the photocells. Curves representing the effect of the bias current, frequency, admittance, and bias voltage on the inductance of the above devices are given. Orig. art. has: 7 figures.

ABSTRACT: Results of an experimental investigation of point-contact germanium (D2-Ye and D2-B) diodes,¹⁰ junction-type germanium P-401 transistors,¹⁰ and laboratory-model silicon photocells are reported. The experimental hookup and methods were similar to those used for investigating selenium rectifiers (ibid., pp 17-29). It was found that the point-contact germanium diodes, with a negative bias in the region of drooping current-voltage characteristics, possess an inductance up to a few henrys; this inductance falls to zero when the supply frequency is increased to 10-15 kc. Inductance also was observed in the emitter-collector of P-403 and

Card 1/2

L 11146-63

germanium diode was used as a negative resistance. Oscillograms presented in the article show that with a low bias, saw-toothed oscillations were set up; with a higher bias, the wave shape approaches the sine wave and the oscillation frequency diminishes. These indicants prove that the selenium rectifier acts as an inductance at higher bias voltages. Orig. art. has: 2 figures and 43 formulas.

ABSTRACT: In another article by Avak'yants, et al. (ibid., pp 17-29), the recombination of electrons from the conduction band to the impurity acceptor levels was neglected as well as the recombination of electrons to the free donor levels in the deep donor-level scheme. In the present article a complete set of differential equations of particle balance is considered. An oscillatory circuit comprising a semiconductor diode with a considerable bias voltage, a capacitance, and a negative resistance in series is analyzed theoretically. The behavior of a selenium diode in an oscillatory circuit was also tested experimentally. A point-contact D2-E

a-c signal and a d-c bias up to 30 v. "Investigation was carried out within -100 +120C temperature range." [Abstracter's note: only the data at +17, +35, +60, and +95C are reported]. It was found that at low temperatures and high bias voltages the selenium rectifiers behave as inductance. Special rectifiers prepared in the laboratory exhibited inductance at room or higher temperatures and at low bias voltages. Rectifier reactance vs. bias, inductance vs. frequency, inductance vs. admittance, and reverse current vs. frequency curves are presented. Inductance of selenium rectifiers can be made very high; however, such rectifiers have a low (not over 1) Q-factor. Orig. art. has: 9 figures and 42 formulas.

TITLE: Inductive properties of selenium rectifiers [Report at the All-Union Conference on Semiconductor Devices, Tashkent, 2-7 October 1961]

SOURCE: Elektronno-dy*rochny*ye perekhody* v poluprovodnikakh. Tashkent, Izd-vo AN UzSSR, 1962, 17-29

TOPIC TAGS: selenium rectifier, selenium rectifier inductance

ABSTRACT: High-inductance semiconductor devices play a decisive role in development of subminiature apparatus. It was reported elsewhere that specially processed germanium diodes behave as inductance. The article offers a theoretical and experimental investigation of inductive properties of selenium rectifiers. Generation and recombination of carriers in the space charge of a hole-type-semiconductor rectifier are investigated mathematically. Under the conditions of deep impurity levels and non-saturated reverse current, the semiconductor diode behaves as an inductance; deep impurities deter the carriers, and the energy is stored in the form of electric field of the space charge. The inductance of types AVS and TVS selenium rectifiers was measured, at audio frequency, on an a-c bridge with a 25-mv

in the n-region separated from the metallic electrode by a gap of given width. It is further assumed that apart from the impurities determining the type of conductivity the p- and n-regions of this diode include deep, weakly ionized impurity levels with a high activation energy, uniformly distributed over the depth of the junction. Theoretical reverse current-voltage characteristics are calculated under these assumptions with a forward current either present or absent, whence a condition is derived which the carrier generation and recombination coefficients must fulfill in order that the sign denoting the influence of the forward current on the reverse current may be correct. In experiments on several rectifiers of ABC-(A7S-) and TBC-(TVS-) type, it is generally found that the difference Δj of the reverse currents in the dynamic and pulsed regimes is slightly negative for voltages between 5 and 15v but changes its sign to positive and becomes much larger for higher voltages. The temperature dependence of Δj was measured between -100 and +100°. At low voltages (15v) this temperature dependence is weak but at higher voltages (35v) it is much stronger and the sign of Δj can change with temperature. A qualitative explanation of the observed effects is possible in terms of the theory as developed, though in fact the experimental reverse current-

TEXT: If an alternating voltage is applied to a selenium rectifier, the parts of the semiconductor at the boundary between the space charge region and the quasineutral region are periodically emptied and refilled with mobile charge carriers according to the sign of the voltage. Experimental data (I. S. Grinberg, DAN UzSSR, 1959, no. 1; 1960, no. 8) show that the reverse current which flows through the rectifier during the halfperiod of reverse voltage is smaller if the forward current flows during the other half period (dynamic regime) and larger if there is no forward current during the other half period (pulsed regime). As a model for the selenium rectifier, a thin diode is studied theoretically which has a space charge

in South Mangyshlak and South Ustyurt. Two million meters of deep drilling will be necessary. The most promising directions and regions for the exploration are now being determined. These are: 1) the Mesozoic structures and the sea bottom at Karaton; 2) the region north of Dossor-Makat where high-quality fatty oil is suspected; 3) the north-eastern part of the Caspian depression in the direction from Makat toward Shchurkuduk; and 4) the region between Volga and Ural where abundant natural escape of gas has already been attracting the attention of geologists for a long time. Of the other regions, South Mangyshlak and South Ustyurt are the most promising petroleum deposits. In the time of the Seven-year Plan a number of scientific explorations are planned in Western Kazakhstan, geological surveying of the entire territory of Ustyurt and most of the Caspian depression on a scale 1 : 200 000, seismic exploration, trial drilling and electroexploratory work according to the telluric current method with the presence of tectonic elements of first and second order has been determined. For the exploration of Paleozoic deposits in the central part of the Caspian depression 10 drillings are planned, one of them to be in

Pyroclastic material is also present; its maximum amount on the western coast is observed in the area of the town of Chekhov. On the eastern coast, the Nevel'sk group is composed of tuff agglomerates. Lithologically, the sediments of the Nevel'sk group may be divided into four subgroups in the Nevel'sk region and into two subgroups in the Aniva and Chekhov areas. In the northern portion of southern Sakhalin the Nevel'sk group does not lend itself to a more detailed division. The age of the fold is determined, on the basis of its faunal remains, to be middle Miocene. The accumulation of sediments of the Nevel'sk group occurred in the coastal zones of the sea under conditions of nonuniform sinking of the bottom of the basin. The region of Primor'ye (Maritime Territory) was the source area of the sediments of the Nevel'sk period. This fact has been confirmed by mineralogical investigations. The conditions of sediment accumulation in the Nevel'sk group were favorable for the formation of petroleum and gas. Four gas-petroleum strata are observed in the Nevel'sk area; the Gornozavodsk anticline has the

ABSTRACT: The character of the sediments of the Nevel'skaya
group on the western coast of southern Sakhalin
varies; the width of the formation changes, north to
south, from 1500 m in the Nevel'sk region down to 400
m to 500 m in the Lesogorsk region. Moreover, the
sediments become more arenaceous in this direction.

PHASE I BOOK EXPLOITATION

SOV/5214

Grinberg, Georgiy Samoylovich, and Vadim Nikolayevich Smirnov

Komplektnyye ustroystva elektrotehnicheskikh ustanovok (Preassembled Units of
Electrotechnical Installations) Moscow, Gosenergoizdat, 1960. 135 p.
15,000 copies printed.

Ed.: M.P. Leplinskiy; Tech. Ed.: N.I. Borunov.

PURPOSE: This book is intended for engineers, technicians, and designers concerned
with the planning, mounting, and operation of electrical engineering installations
and for technical personnel of plants manufacturing preassembled units. It may
also be useful to students specializing in power supply and electrical equipment.

COVERAGE: The book describes the structures of preassembled units used in electro-
technical installations of industrial and public buildings and dwellings of the
USSR. It contains concise information on the manufacturing processes and ma-
terials used for preassembled units, as well as recommendations regarding their
design. The data are based on manufacturing practices of the Ministerstva
stroitel'stva RSFSR i USSR (Ministries of Construction RSFSR and UkrSSR),
